Reference to a compound described herein is understood to include reference to salts thereof, unless otherwise indicated. The term “salt(s)”, as employed herein, denotes acidic and/or basic salts formed with inorganic and/or organic acids and bases. In addition, when a compound described herein contains both a basic moiety and an acidic moiety, zwitterions (“inner salts”) may be formed and are included within the term “salt(s)” as used herein. In one embodiment, the salts are pharmaceutically acceptable (i.e., non-toxic, physiologically acceptable), although other salts are also useful, e.g., in isolation or purification steps which may be employed during preparation. Salts of the compounds described herein may be formed, for example, by reacting a compound with an amount of acid or base, such as an equivalent amount, in a medium such as one in which the salt precipitates or in an aqueous medium followed by lyophilization.

The present invention is intended to cover the compounds in their neutral state, salts of those compounds, or mixtures of the compounds in their neutral state with one or more salt forms, or mixtures of salt forms.

Any compound that can be converted in vivo to provide the bioactive agent (i.e., the compound of formula (I)) is a pro-drug within the scope and spirit of the invention.

The term “prodrugs” as employed herein includes esters and carbonates formed by reacting one or more hydroxyls of compounds of formula (I) with alkyl, alkoxy, or aryl substituted acylating agents employing procedures known to those skilled in the art to generate acetates, pivalates, methylcarbonates, benzoates, and the like.

Various forms of prodrugs are well known in the art and are described in:

- Wermuth, C. G. et al., *The Practice of Medicinal Chemistry*, Chapter 31, Academic Press (1996);
- Design of Prodrugs*, H. Bundgaard, ed., Elsevier (1985);

“Pharmaceutically acceptable” refers to those compounds, materials, compositions, and/or dosage forms which are, within the scope of sound medical judgment, suitable for contact with the tissues of human beings and animals without excessive toxicity, irritation, allergic response, or other problems or complications commensurate with a reasonable benefit/risk ratio or which have otherwise been approved by the United States Food and Drug Administration as being acceptable for use in humans or domestic animals.

The various compounds described herein, or their pharmaceutically acceptable salts, may contain one or more asymmetric centers and may thus give rise to isomers, such as enantiomers, diastereomers, and other stereoisomeric forms. Such forms may be defined, in terms of absolute stereochemistry, as (R)- or (S)-, or as (D)- or (L)- for amino acids. The present invention is meant to include all such possible individual stereoisomers and mixtures thereof, including their racemic and optically pure enantiomeric or diastereomeric

forms. The compounds may be prepared as racemates and can conveniently be used as such, or optically active (+) and (−), (R)- and (S)-, or (D)- and (L)-isomers or corresponding diastereomers may be prepared using chiral synthons or chiral reagents, or they may be resolved from racemic mixtures using conventional techniques, such as chiral chromatography or reverse phase HPLC. When the compounds described herein contain olefinic double bonds or other centers of geometric asymmetry, and unless specified otherwise, it is intended that the compounds include both E and Z geometric isomers.

The invention also includes isotopically-labeled compounds of the invention, wherein one or more atoms is replaced by an atom having the same atomic number, but an atomic mass or mass number different from the atomic mass or mass number usually found in nature. Examples of isotopes suitable for inclusion in the compounds of the invention include isotopes of hydrogen, such as ^2H or D and ^3H or T, carbon such as ^{11}C , ^{13}C , and ^{14}C , chlorine, such as ^{36}Cl , fluorine such as ^{18}F , iodine, such as ^{123}I and ^{125}I , nitrogen, such as ^{13}N and ^{15}N , oxygen, such as ^{15}O , ^{17}O , and ^{18}O , phosphorus, such as ^{32}P , and sulfur, such as ^{35}S . Certain isotopically-labeled compounds of the invention, for example, those incorporating a radioactive isotope, are useful in drug and/or substrate tissue distribution studies. The radioactive isotopes tritium, ^3H , and carbon-14, ^{14}C , are particularly useful for this purpose in view of their ease of incorporation and ready means of detection. Substitution with heavier isotopes such as deuterium, ^2H or D, may afford certain therapeutic advantages resulting from greater metabolic stability, for example, increase in vivo half-life or reduced dosage requirements, and hence may be preferred in some circumstances. Substitution with positron emitting isotopes, such as ^{11}C , F, ^{15}O , and ^{13}N , can be useful in Positron Emission Topography (PET) studies for examining substrate receptor occupancy.

To the extent that compounds described herein, and salts thereof, may exist in their tautomeric form, all such tautomeric forms are contemplated herein as part of the present invention.

All stereoisomers of the present compounds, such as those which may exist due to asymmetric carbons on the various substituents, including enantiomeric forms (which may exist even in the absence of asymmetric carbons) and diastereomeric forms are contemplated within the scope of this invention. Individual stereoisomers of the compounds of the invention may, for example, be substantially free of other isomers, or may be admixed, for example, as racemates or with all other, or other selected, stereoisomers.

“Stable compound” and “stable structure” are meant to indicate a compound that is sufficiently robust to survive isolation to a useful degree of purity from a reaction mixture, and formulation into an efficacious therapeutic agent. The present invention is intended to cover stable compounds.

When any variable (e.g., R^{13}) occurs more than one time in any constituent or formula for a compound, its definition at each occurrence is independent of its definition at every other occurrence. Thus, for example, if a group is shown to be substituted with 0-2 R^{13} , then said group may optionally be substituted with up to two R^{13} groups and R^{13} at each occurrence is selected independently from the definition of R^{13} . Also, combinations of substituents and/or variables are permissible only if such combinations result in stable compounds.

“Therapeutically effective amount” refers to that amount of a compound which, when administered to a subject, is sufficient to effect treatment for a disease or disorder

SYNTHESIS

A particularly useful compendium of synthetic methods which may be applicable to the preparation of compounds of

28

the present invention may be found in Larock, R. C., *Comprehensive Organic Transformations*, VCH, New York (1989). Preferred methods include, but are not limited to, those described below. All references cited herein are hereby

incorporated in their entirety herein by reference. The novel compounds of this invention may be prepared using the reactions and techniques described in this section. Also, in the description of the synthetic methods described below, it is to be understood that all proposed reaction con-
 10 conditions, including choice of solvent, reaction atmosphere, reaction temperature, duration of the experiment and workup procedures, are chosen to be the conditions standard for that reaction, which should be readily recognized by one skilled in the art. Restrictions to the substituents that are compatible with the reaction conditions will be readily apparent to one
 15 skilled in the art and alternate methods must then be used.

It will also be recognized that another major consideration in the planning of any synthetic route in this field is the judicious choice of the protecting group used for protection of the reactive functional groups present in the compounds described in this invention. An authoritative account describ-
 20 ing the many alternatives to the trained practitioner is Greene et al. (*Protective Groups in Organic Synthesis*, Wiley and Sons (1991)).

Scheme 1

29

-continued

Compounds of formula (I) may be synthesized according to Scheme 1. Commercially available methylpyrrolidine-2-carboxylate 1 was protected using a protecting group, for example, Boc and 2 was converted to 1-tert-butyl 2-methyl 3-bromo-1H-pyrrole-1,2-dicarboxylate 3 using NBS which acts as a brominating as well as oxidizing agent (*Aust. J. Chem.*, 62(7):683-691 (2009)). Palladium mediated Suzuki cross-coupling with boronic acids or esters (R is optionally substituted aryl, heteroaryl, alkyl or cycloalkyl) followed by deprotection gave the aryl pyrrole derivative 5. N-amination of 5 gave compounds of general formula 6 which on acylation gave corresponding compounds 7. When treated with ammonia under pressure, 7 undergoes cyclization to form the pyrrolotriazine core 8. Subsequent displacement at C4 by amines using activating agents for example, BOP reagent yield compounds of general formula (I).

30

-continued

25

Scheme 2

Alternatively, compounds of formula (I) can be synthesized by the general sequence shown in Scheme 2. N-amino derivative 6 was treated with methylchloroformate and the resulting acyl derivative 9 was subjected to ring closure with ammonia under pressure to yield the pyrrolotriazine core 10. Intermediate 10 was converted to the corresponding dichloro derivative 11 using chlorinating agents for example, phosphorous oxychloride. Sequential displacement of chloro of 11 at the 4 position followed by transition metal mediated cross coupling or displacement of the C2 chloride of 12 formed compounds of general formula (I).

31

32

Alternately, compounds of formula (I) can be synthesized by the general sequence shown in Scheme 3. Commercially available 5-methyl-3,4-dihydro-2H-pyrrole 13 was treated with N-chlorosuccinimide followed by sodium methoxide to generate methyl 3-chloro-1H-pyrrole-2-carboxylate 14. Compound 14 was N-aminated and the product 15 was acylated to yield methyl 3-chloro-1-(methoxycarbonylamino)-1H-pyrrole-2-carboxylate 16. Compound 16 was treated with ammonia to yield 5-chloropyrrolo[1,2-f][1,2,4]triazine-2,4-diol 17. Compound 10 can be obtained from 17 by transition metal mediated Suzuki cross-coupling reactions with boronic acids or esters. Compound 17 gave 2,4,5-trichloropyrrolo[1,2-f][1,2,4]triazine 18 on treatment with chlorinating agents for example, POCl₃ and then displacement of the C4 chloro with amines gave regioselectively 19. Using different palladium reagent/ligand combinations we could achieve regioselective Suzuki cross-couplings at C2 and C5 to generate compounds of general formula (I).

NMR Employed in Characterization of Examples.

¹H NMR spectra were obtained with Bruker or JEOL® Fourier transform spectrometers operating at frequencies as follows: ¹H NMR: 400 MHz or 300 MHz (Bruker) ¹³C NMR: 100 MHz or 75 MHz (Bruker). Spectra data are reported in the format: chemical shift (multiplicity, coupling constants, number of hydrogens). Chemical shifts are specified in ppm downfield of a tetramethylsilane internal standard (δ units, tetramethylsilane=0 ppm) and/or referenced to solvent peaks, which in ¹H NMR spectra appear at 2.49 ppm for CD₂HSOCD₃, 3.30 ppm for CD₂HOD, and 7.24 ppm for CHCl₃, and which in ¹³C NMR spectra appear at 39.7 ppm for CD₃SOCD₃, 49.0 ppm for CD₃OD, and 77.0 ppm for CDCl₃. All ¹³C NMR spectra were proton decoupled.

Example 1

5-(4-(Benzylamino)-5-phenylpyrrolo[1,2-f][1,2,4]triazin-2-yl)pyridine-3-sulfonamide

48

Synthesis was carried out according to the procedure reported: Hasse et al., *Aust. J. Chem.*, 62(7):683-691 (2009). N-Bromo succinimide was recrystallized from water and (100 g, 564 mmol) was added to a solution of 1-tert-butyl 2-methyl pyrrolidine-1,2-dicarboxylate (34.0 g, 148 mmol) in carbon tetrachloride (17 L). The resulting suspension was heated at 85° C. for 2 h. The reaction mixture was cooled to 0° C. and the precipitated succinimide removed by filtration. The filtrate was concentrated under reduced pressure. The oil obtained was subjected to column chromatography (RE-DISEP®, silica gel, 120 g, 10% EtOAc/hexanes), gave 1-tert-butyl 2-methyl 3-bromo-1H-pyrrole-1,2-dicarboxylate (18.0 g, 39.1%) as an orange liquid. ¹H NMR (400 MHz, CD₃OD) δ ppm 1.53 (s, 9H), 3.32 (s, 3H), 6.46 (d, J=3.6 Hz, 1H), 7.44 (d, J=3.6 Hz, 1H).

To a solution of 1-tert-butyl 2-methyl 3-bromo-1H-pyrrole-1,2-dicarboxylate (17.6 g, 57.9 mmol) in toluene (200 mL) and water (200 mL) was added K₂CO₃ (64.0 g, 463 mmol), followed by phenylboronic acid (10.6 g, 87.0 mmol) and tetrabutylammonium bromide (1.68 g, 5.21 mmol). The reaction mixture degassed for 10 min with nitrogen and then tetrakis(triphenylphosphine)palladium (1.34 g, 1.16 mmol) was added. The resulting slurry was degassed with nitrogen for 30 min and then heated to reflux for 16 h. The reaction mixture was concentrated under reduced pressure to remove water and toluene. Water was then added to the residue and the mixture extracted by ethyl acetate. The combined organic layers were dried over sodium sulfate, filtered and concentrated under reduced pressure. The residue was purified by column chromatography using CombiFlash (REDISEP®, silica gel, 80 g, 20% EtOAc/hexanes) to obtain 1-tert-butyl 2-methyl 3-phenyl-1H-pyrrole-1,2-dicarboxylate (11.5 g, 65.9%) as a tan solid. ¹H NMR (400 MHz, CD₃OD) δ ppm 1.60 (s, 9H), 3.79 (s, 3H), 6.40 (d, J=3.4 Hz, 1H), 7.37 (m, 6H).

49

1-tert-Butyl 2-methyl 3-phenyl-1H-pyrrole-1,2-dicarboxylate (18.0 g, 59.7 mmol) was dissolved in CH_2Cl_2 (20 mL) and cooled to 0°C . TFA (23.0 mL, 0.299 mmol) was added to the reaction mixture and the solution stirred at room temperature for 14 h. The reaction mixture was concentrated under reduced pressure to remove excess of TFA. To the resulting residue was added 10% sodium bicarbonate solution (50 mL) and the aqueous portion extracted with CH_2Cl_2 . The organic layer was separated, dried over sodium sulfate, filtered and concentrated under reduced pressure. The residue was purified by column chromatography using CombiFlash (REDISEP®, silica gel, 40 g, 30% EtOAc/hexanes) to obtain methyl 3-phenyl-1H-pyrrole-2-carboxylate (7.50 g, 62.4%). ^1H NMR (400 MHz, $\text{DMSO}-d_6$) δ ppm 3.69 (s, 3H), 6.29 (t, $J=2.8$ Hz, 1H), 7.02 (d, $J=2.8$ Hz, 1H), 7.03 (m, 5H), 12.0 (s, 1H).

Synthesis of Monochloramine Reagent

Ammonium chloride (3.00 g, 56.1 mmol) was dissolved in ether (110 mL) and the solution cooled to -5°C . Concentrated ammonium hydroxide (28.0 M, 4.70 mL, 120 mmol) was added dropwise. Commercial bleach that is sodium hypochlorite (2M, 72.0 mL, 0.144 mol) was added via addition funnel over 15 min. The reaction mixture was stirred for 15 min, the layers were separated and the organic layer was washed with brine. The organic layer was dried over powdered CaCl_2 in a freezer for 1 h and stored at -40°C . The approximate concentration of monochloramine is 0.15 M.

To a solution of methyl 3-phenyl-1H-pyrrole-2-carboxylate (2.50 g, 12.4 mmol) in DMF (25 mL) was added NaH (0.358 g, 14.9 mmol) and the reaction mixture was stirred for 45 min at room temperature. Monochloramine (0.15 M, 150 mL, 0.225 g, 4.40 mmol) was added via syringe. The reaction was stirred for 2 h and was quenched by the addition of saturated aqueous sodium thiosulfite. The reaction mixture was diluted with water and the aqueous portion extracted with ethyl acetate. The organic layer dried over anhydrous sodium

UTILITY

In general, compounds of the present invention, such as particular compounds disclosed in the preceding examples, have been shown to inhibit the K_v1 subfamily of voltage-gated K⁺ channels (for example, by displaying % inhibition values ≥14%, preferably ≥30%, more preferably ≥40%, even more preferably ≥50%, at 0.3 micromolar concentration in an assay such as those set forth below). By displaying activity as inhibitors of the K_v1 subfamily of voltage-gated K⁺ channels, compounds of the present invention are expected to be useful in the treatment of human diseases associated with the K_v1 subfamily of voltage-gated K⁺ channels.

Assays to determine the degree of activity of a compound as an I_{K_{ur}} inhibitor are well known in the art and are described in references such as *J. Gen. Physiol.*, 101(4):513-543 (April 1993), and *Br. J. Pharmacol.*, 115(2):267-274 (May 1995).

Assays to determine the degree of activity of a compound as an inhibitor of other members of the K_v1 subfamily are also well known in the art. For example, inhibition of K_v1.1, K_v1.2 and K_v1.3 can be measured using procedures described by Grissmer, S. et al., *Mol. Pharmacol.*, 45(6):1227-1234 (June 1994); inhibition of K_v1.4 can be measured using procedures described by Petersen, K. R. et al., *Pflugers Arch.*, 437(3):381-392 (February 1999); inhibition of K_v1.6 can be measured using procedures described by Bowlby, M. R. et al., *J. Neurophysiol.* 73(6):2221-2229 (June 1995); and inhibition of K_v1.7 can be measured using procedures described by Kalman, K. et al., *J. Biol. Chem.*, 273(10):5851-5857 (Mar. 6, 1998).

The Examples, as shown in Table 2, were assayed for block of I_{K_{ur}} current in patch clamped mammalian L-929 cells which were injected with human K_v1.5 mRNA and stably expressed I_{K_{ur}} protein (as described in the references

described below). Inhibition data at 0.3 mM concentration for the Examples are shown in Table 2.

185	Prodrug

Examples 46 and 185 are prodrugs. Prodrugs prepared as described had significantly increased solubility at pH 7 and demonstrated an improved profile with respect to pH dependent solubility. Prodrugs would be expected to cleave to the respective parent compound with $K_v1.5$ activity on oral dosing. Therefore, Examples 46 and 185, and other prodrugs, may be useful in the inhibition of potassium channel function and may be useful in the treatment and prevention of arrhythmia, $I_{K_{AT}}$ -associated disorders, and other disorders mediated by ion channel function, by providing the active compounds which have been shown to be an inhibitor of potassium channel function.

The compounds of the present invention are suspected antiarrhythmic agents which are useful in the prevention and treatment (including partial alleviation or cure) of arrhythmias. As inhibitors of $K_v1.5$, compounds within the scope of the present invention are particularly useful in the selective

prevention and treatment of supraventricular arrhythmias such as atrial fibrillation, and atrial flutter. By "selective prevention and treatment of supraventricular arrhythmias" is meant the prevention or treatment of supraventricular arrhythmias wherein the ratio of the prolongation of the atrial effective refractory period to the prolongation of the ventricular effective refractory period is greater than 1:1. This ratio can also be greater than 4:1, even greater than 10:1. In addition, the ratio may be such that prolongation of the atrial effective refractory response period is achieved without significantly detectable prolongation of the ventricular effective refractory period.

In addition, the compounds within the scope of the present invention block I_{Kur} , and thus may be useful in the prevention and treatment of all I_{Kur} -associated conditions. An " I_{Kur} -associated condition" is a disorder which may be prevented, partially alleviated or cured by the administration of an I_{Kur} blocker. The $K_v1.5$ gene is known to be expressed in stomach tissue, intestinal/colon tissue, the pulmonary artery, and pancreatic beta cells. Thus, administration of an I_{Kur} blocker can provide useful treatment for disorders such as: reflux esophagitis, functional dyspepsia, constipation, asthma, and diabetes. Additionally, $K_v1.5$ is known to be expressed in the anterior pituitary. Thus, administration of an I_{Kur} blocker can stimulate growth hormone secretion. I_{Kur} inhibitors can additionally be useful in cell proliferative disorders such as leukemia, and autoimmune diseases such as rheumatoid arthritis and transplant rejection.

The present invention thus provides methods for the prevention or treatment of one or more of the aforementioned disorders, comprising the step of administering to a subject in need thereof an effective amount of at least one compound of the formula (I), (Ia), or compounds exemplified in the examples. Other therapeutic agents such as those described below may be employed with the inventive compounds in the present methods. In the methods of the present invention, such other therapeutic agent(s) may be administered prior to, simultaneously with or following the administration of the compound(s) of the present invention.

DOSAGE AND FORMULATION

The present invention also provides pharmaceutical compositions comprising at least one of the compounds of the formula (I), (Ia), or compounds exemplified in the examples, or salts thereof capable of preventing or treating one or more of the aforementioned disorders in an amount effective therefor, and a pharmaceutically acceptable vehicle or diluent. The compositions of the present invention may contain other therapeutic agents as described below, and may be formulated, for example, by employing conventional solid or liquid vehicles or diluents, as well as pharmaceutical additives of a type appropriate to the mode of desired administration (for example, excipients, binders, preservatives, stabilizers, flavors, etc.) according to techniques such as those well known in the art of pharmaceutical formulation.

The compounds of the formula (I), (Ia), or compounds exemplified in the examples, may be administered by any suitable means, for example, orally, such as in the form of tablets, capsules, granules or powders; sublingually; buccally; parenterally, such as by subcutaneous, intravenous, intramuscular, or intrasternal injection or infusion techniques (e.g., as sterile injectable aqueous or non aqueous solutions or suspensions); nasally such as by inhalation spray; topically, such as in the form of a cream or ointment; or rectally such as in the form of suppositories; in dosage unit formulations containing non toxic, pharmaceutically acceptable vehicles or diluents.
